|--------|-------------|

**Westergren ESR :**

is the rate at which red blood cells sediment in a period of one hour. It is a common hematology test, and is a non-specific measure of inflammation.

The ESR is increased in inflammation, pregnancy, anemia, autoimmune disorders (such as rheumatoid arthritis and lupus), chronic infection, some kidney diseases and some cancers (such as lymphoma and multiple myeloma).

| Instrument                                    | · Fully automated biochemistry analyser |       |                                                                                      |

NOTE : Lipid Profile RANGES AS PER NCEP Guidelines are:

Serum cholesterol (Total) ;

Desirable : < 200 mg/dl, Borderline : 200 - 239 mg/dl, Elevated :  $\geq$  240 mg/dl

Serum high density lipoprotein cholesterol (HDL) ;

Desirable : &gt; 60 mg/dl, Borderline : 40- 60 mg/dl, Reduced : 40 mg/dl

Total cholesterol : HDL cholesterol ratio :

Low risk : 3.3-4.4, Average risk : 4.4-7.1, Moderate risk : 7.1-11.0, High risk :  $>11.0$ 

Serum low density lipoprotein (LDL) cholesterol :

Desirable : 100 mg/dl, Borderline : 100- 159 mg/dl, Elevated :  $\geq$  160 mg/dl

Triglycerides :

Desirable : 150 mg/dl, Borderline : 150- 199 mg/dl, High : 200 - 499 mg/dl, Very High :  $\geq$  500 mg/dl

HDL measurement done by Direct HDL clearance method.

As per the Friedwald Equation, VLDL &amp; LDL values are not applicable for triglyceride values above 400 mg/dl,

REGISTERED ON : 26/08/2024 12:00PM

REPORTED ON : 26/08/2024 02:21PM

**BIOCHEMISTRY****TEST****RESULT****UNIT****BIOLOGICAL REF RANGE****\*SERUM URIC ACID**

Sample Type

: PLAIN SERUM

Uric Acid

: 6.41

MG/DL

2.5-7.2

Method

: Colorimetric - Uricase , Peroxidase

Instrument

: Fully automated biochemistry analyser

\* Uric acid is useful for 1. Diagnosis and follow up of renal failure. 2. Monitoring patients receiving cytotoxic drugs and a variety of other disorders, including gout, leukemia, psoriasis, starvation and other wasting conditions

. \* Increased uric acid is seen in following conditions :

1. Increased purine synthesis 2. Inherited metabolic disorders 3. Excess dietary purine intake 4. Increased nucleic acid turnover 5. Malignancy, cytotoxic drugs 6. Decreased urinary excretion (due to CRF) 7. Increased renal reabsorption .

\* Uric acid is decreased in : 1. Hepatocellular disease with reduced purine synthesis 2. Defective renal reabsorption 3. Over treatment of uricemia (allopurinol or cancer therapies like 6-mercaptopurine, etc).

**\*SERUM CALCIUM**

Sample Type

: PLAIN SERUM

Calcium

: 10.07

mg/dL

8.4-11.5

Method

: Colorimetric -Arsenazo Method

Instrument

: Fully automated biochemistry analyser (MISPAace by AGAPPE)

**NOTE**

1) Calcium plays an essential role in many cell functions: intracellular in muscle contraction and glycogen metabolism, extracellular in bone mineralization, in blood coagulation and in transmission of nerve impulses.

2) Calcium in plasma exists in three forms: free, bound to proteins or bound to anions such as phosphate, citrate and bicarbonate in a complex reaction. Decreased total calcium levels can be associated with diseases of the bone apparatus (especially osteoporosis), kidney diseases (especially under dialysis), defective intestinal absorption and hypoparathyroidism.

3) Increased total calcium can be measured in hyperparathyroidism, malignant diseases with metastases and sarcoidosis. Calcium measurements also help in monitoring of calcium supplementation mainly in the prevention of osteoporosis.

**\*SGPT/ALT**

Sample Type

: PLAIN SERUM

SGPT (ALT)

: 49.22

U/L

0-45

Method

: Multipoint-Rate/ Colorimetric with P-5-P (pyridoxa-5-phosphate)

Instrument

: Fully automated biochemistry analyser

**ENDOCRINOLOGY****TEST****RESULT****UNIT****BIOLOGICAL REF RANGE****THYROID STIMULATING HORMONES**

Sample Type : PLAIN SERUM

Thyroid Stimulating Hormone (Ultra TSH) 4.16 uIU/ML 0.25-5.50

Method : Fully Automated Enhanced Chemiluminescence System

Instrument : Access 2 from Beckman Coulter(USA)

**NOTE:**

1)Thyroid-stimulating hormone (TSH, thyrotropin) is a glycoprotein having a molecular weight of approx. 30,000 daltons and consisting of two subunits.

2)The beta-subunit carries the TSH-specific immunological and biological information, whereas the alpha-chain carries species-specific information and has an identical amino acid sequence to the alpha-chains of LH, FSH and hCG.

3)TSH is formed in specific basophil cells of the anterior pituitary and is subject to a circadian secretion sequence.

4)The hypophyseal release of TSH (thyrotropic hormone) is the central regulating mechanism for the biological action of thyroid hormones.

5)TSH has a stimulating action in all stages of thyroid hormone formation and secretion; it also has a proliferative effect. The determination of TSH serves as the initial test in thyroid diagnostics.

6)Even very slight changes in the concentrations of the free thyroid hormones bring about much greater opposite changes in the TSH level.

7)Accordingly, TSH is a very sensitive and specific parameter for assessing thyroid function and is particularly suitable for early detection or exclusion of disorders in the central regulating circuit between the hypothalamus, pituitary and thyroid

The Guideline for pregnancy reference ranges for,Ultra TSH Level in pregnancy

First Trimester 0.10-2.5

Second Trimester 0.20-3.0

Third Trimester 0.30-3.0
